

Create A Website for a Band

Build a Static (Front-end Only) Website for a band. As a starting point you may want to use wireframe's as you did in the UX lesson, you can use Balsamiq or any other tool, including just a pen and paper. You can use either your assets or any of the assets within the following GitHub repository. The band is an 80's Heavy Metal Band that have over 30 years' experience of performing live all over the world. You have been given the following requirements after meeting with the client's representatives:

Their primary target audiences are their fans and potential fans that wish to use the website to use the site to see and hear clips from their back catalogue, and any new material as it becomes available.

Target fans with a dummy fan club sign up form, also the band wants to use the site to showcase their music. Include a albums page where fans can listen to clips of their back catalogue of music and find out more information about their albums.

Publicize their availability to perform at events.

Include a hire us page with a form which customers can use to select available dates, leave their Name, Address, Email, and their Contact Number.

The band has provided you the developer, with the following assets that they would like to showcase on their Website:

Gallery Page so that fans can look at their pictures and a music page where fans can listen to their music.

They are also in the process of building a social media presence and would like to add at least three social media links to their site.

Social Media Links.
